Supplementary Figure S1. Sensitivity of phenotypes and treatment effects to Apgar exclusion

A. Principal component analysis without Apgar

Projection of the four clustering variables

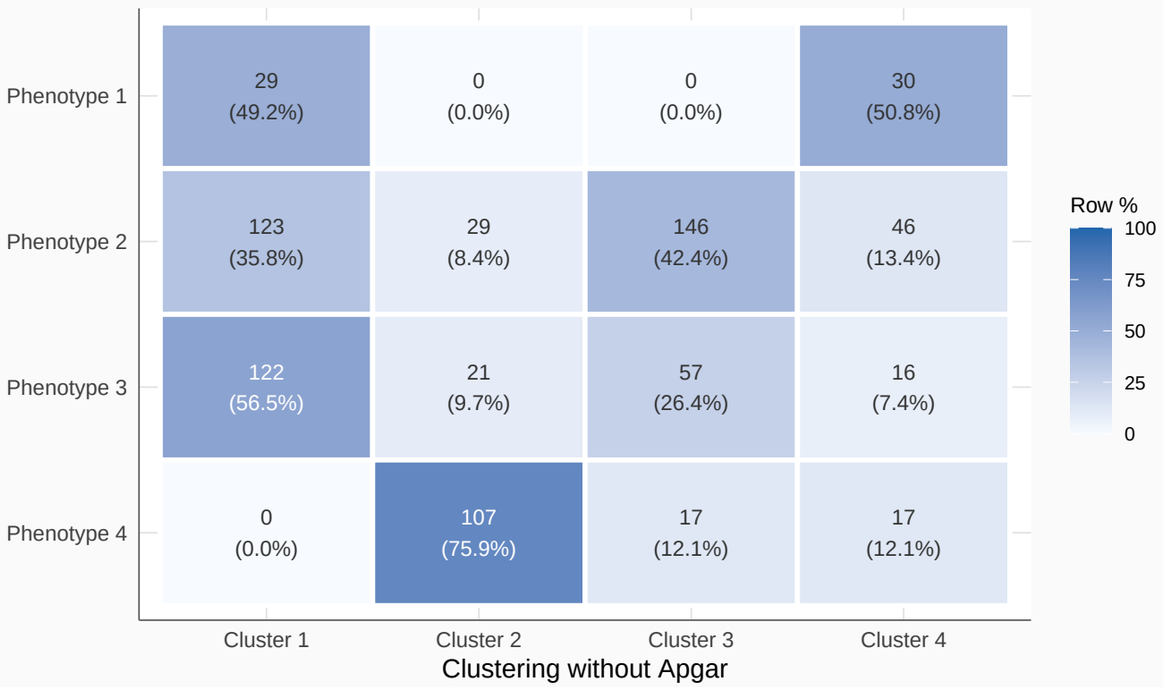

B. Standardized baseline features

Apgar is shown descriptively; it was excluded from clustering

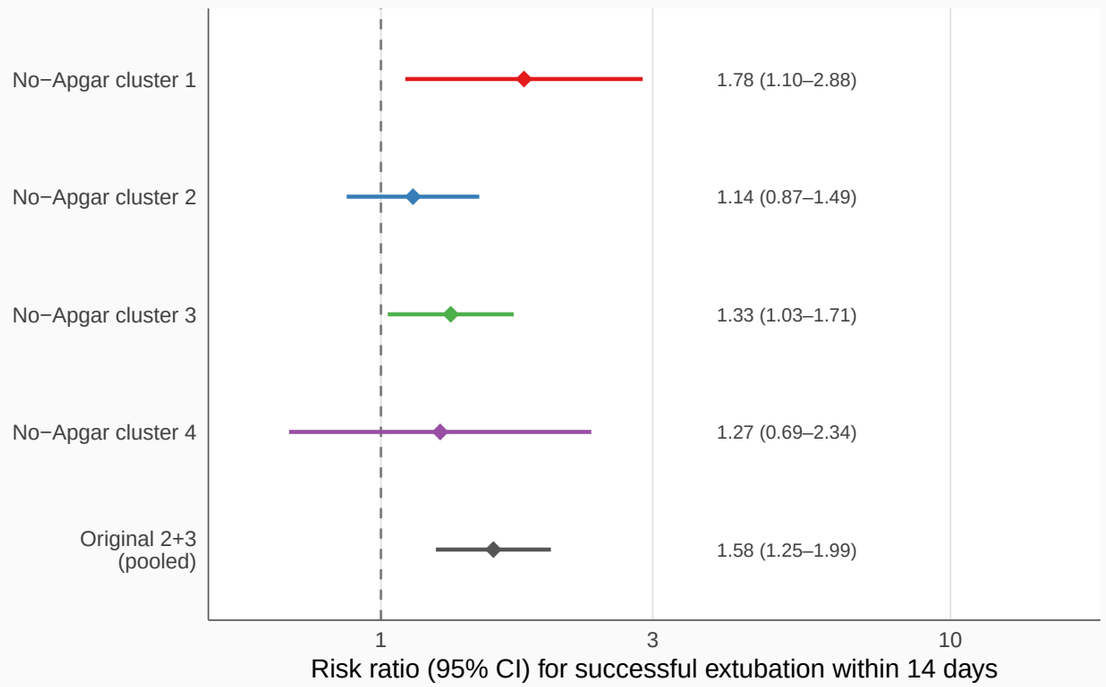

C. Correspondence with original phenotypes

Adjusted Rand index = 0.160; cells show n (row %)

D. Hydrocortisone treatment effects

No−Apgar treatment−by−cluster interaction P = 0.452

Alternative cluster numbers and colors do not imply correspondence with original phenotype labels.
